## **Group 2**

- - 1. Hashimu Mohammed
  - 2.Mohammed Hassan
  - 3.Hafsat Abubakar
  - 4.Umar Muhammad

Most common three child illness found in Nigeria. Are as follows

- 1. MALARIA
- 2. CHOLERA
- 3. PNEUMONIA

#### MALARIA

Malaria is one of the most common illness that can affect children in Nigeria, children affected with malaria commonly shows below sign and symptoms.

- 1. Fever
- 2. Headache
- 3. Low park cell volume (p.c.v)
- 4. Dizness

And lastly it's lead to death of a child as stated by our country'world health organization.

## MALARIA

Malaria it's a disease caused by a plasmodium parasite. Transmited by the bite of infected female anophelous mosquitoes.

The severity of malaria varies based on the species of plasmodium either

- 1. Plasmodium Falcifarum
- 2. Plasmodium vivax
- 3. Plasmodium Ovalea
- 4. Plasmodium Malarea

#### **CHOLERA**

Cholera is an acute diarrheal illness caused by infection of the intestine with Vibrio Cholerae bacteria. Children can get infected when swallow food and water conterminated with cholera bacteria.

#### SIGN AND SYMPTOMS

- 1. Acute diarrhea
- 2. Dehydration
- 3. Rarely

- 4. Shock
- 5. Suizures may occour in severe causes.

#### Prevention and control of cholera

- 1. Access to safe and clean water
- 2. Adquiate sanitation
- 3. Basic hygine needs
- 4. Vaccination with oral choleral vaccine

#### **PNEUMONIA**

Pneumonia is an infection that affects one or both lungs. It's causes by the air sacs, or alveoli, of the lungs to fill up with fluid àr pus. Bacteria , Viruses,or Fungi may cause pneumonia.

Common sign and symptoms

- 1. Chest pain
- 2. Fever and chills
- 3. Shortness of breath
- 4. cough that produces phlegm or mucus

## Group 3

## □ Diffa Niger Republic

Group participants:

- 1 Mele Ajama
- 2 Sani Zubairu
- 3 Lukuman Musa
- 4 Bello Sani

The commonest child health illnesses that causes mortality among children under five in Nigeria with respect to our community are as follows: As justified by world health organization Malaria; Pneumonia, and diarrhea are trio common causes of such groups of children identified above.

1. Malaria: malaria is disease caused by the mosquitor spp called female anopheles mosquitor which inject plasmodium through biting and blood sucking and later hatched to malaria. it is characterized with the sign and symptoms fever with chills; sweating, headache; back pain, vomiting; nausea, join pain, body weakness and later persistence symptoms lead to death if care is not taking. Africa has higher burden of malaria related cases and deaths globally. children under five accounted for over two to third of all malaria deaths in sub Saharan Africa.

As a community health worker you should organize public enlightenment campaign to educate people about the deadly effects of malaria and its preventive and control measures especially to the pregnant women who are to be advise to go for antenatal visits to health facilities where are to prescribe intermitent preventive therapy for malaria; sleeping in insecticide treated mosquitor net; trimming of vegetation

around residential houses, regular care of										
incinirators to avoid moisquitor breeding ground.										
2. <b>Pneumonia</b> : pneumonia is the second diesease										
that lead to the death of children under five										
especially Nigeria contributes highest number						-			-	
to global pneumonia child deaths.										
Pneumonia is a deadly bacterial mainly in										
developing countries ; viral and fungal causing										
diseases its symptoms includes fever;						-				
coughing, difficulty in breathing, fast breathing										
or shortness of breath; sweating and chest pain:										
the role of community health worker should										
account and educate the general public in his										
or her community on the preventive measure										
to pneumonia like good nutrition and hygien ;										
and avoidance of indoor and outdoor pollution						-			-	
with good ventilation and hand washing										
3. Diarrhea: in Nigeria diarrhoea is the one of the										
worst sub sahara Africa that accounted the									-	
children deaths under five years of age it is										
characterised by its causing factors of absence of										
clean water; essential sanitation and hygien . the										
disease causing agents are bacteria, virus and										-
parasite which results in the dehydration of body										
fluids through stools . Your role as community										
health worker you should advises based for the										
need arises especially preventive curative and										
control measures.

In our country Nigeria, pneumonia has the largest absolute number of annual paediatric pneumonia deaths globally with pneumonia accounting for 20%										

(2)Diarrhoea: is having 3 or more loose or liquid stools (poos) in one day, or more frequently than normal. if you

diarrhoea, you will experience an increase in the volume, wateriness or frequency of your bowel movements.

Diarrhoea is the second leading caused of morbidity and mortality in young children in Nigeria.

Diarrhoea is one the childhood preventable and treatable diseases. It is one of the leading causes of death among children less than five years in our country Nigeria.

Nearly one in five child deaths is due to diarrhoea in Nigeria.

(3)Malaria: is a serious and sometimes fatal disease caused by a parasite that commonly infects a certain type of mosquito which feeds on humans. Peaple who get malaria are typically very sick with high fevers, sheking chills, and flu-like illness.

In Nigeria, malaria is a major public health concern in Nigeria, with an estimated 68 million cases and 194 000 deaths due to the disease in 2021. Nigeria has the highest burden of malaria globally, accounting for nearly 27% of the global malaria burden. The risk of transmission exists throughout the country, all year around.

section Group 4

## **Group 5**

## **Diffa-NIGER REPUBLIC**

Group Members;

- 1: Ali Sha'aibu
- 2: Yagana A Umar
- 3:Makinta Modu
- 4:Tijjani Mohammed

The three common child health illnesses are:

- 1. Pneumonia
- 2. Diarrhoea
- 3. Malaria

Diarrhoea: In Nigeria, diarrhoea prevalence rate is 18.8% and is one of the worst in sub-sahara Africa and above the average of 16%. Annually, it accounts for over 16% of child deaths and aan estimated 150,000 deaths mainly amongst childrend under five years (10).

Pneumonia; is an infection of the lungs. Normally, the small sacs in the lungs are filled with air. In someone who has pneumonia ( nu -MOHnyuh), the air sacs fill up with pus and other fluid.

Malaria: Under -five malaria in Nigeria is a leading cause of global child mortality, accounting for 95,000 annual child deaths. High out -of pocket medical expenditure contributes to under - five malaria mortality by discouraging care-seeking and use of effective anti -malarials in the poorest households.

## 

Noor AL-Sharifi

there is the most common child Health illness:

- Measles: A high fever, cough, runny nose, and a striking red rash are some of the symptoms of this extremely dangerous viral infection. Measles can result in serious side effects, such as pneumonia, and even death, especially in young children who have not had the vaccination. To prevent measles, vaccination with the measles, mumps, and rubella (MMR) vaccine is the most effective method.
- Pneumonia is an inflammatory lung disease that is typically caused by bacterial or viral infections. It can cause coughing, difficulty breathing, chest pain, and fever. Pneumonia is more dangerous in children, and prompt treatment with antibiotics or antiviral medicine is critical for recovery.
- Hepatitis: Hepatitis is an inflammation of the liver caused by a variety of viruses, including hepatitis A, B, and C. Jaundice (yellowing of the skin and eyes), weariness, and abdominal pain are all symptoms of hepatitis. Hepatitis A and B vaccinations are available for children to avoid these diseases.

3.Preumonia

### **Group 8**

## ➡ DIFAN SULEIMAN INZONE KAKUMA ,KENYA

#### Activity one

1. Respiratory Infections:

Respiratory infections, such as the common cold, influenza, or pneumonia, are often prevalent in children. These infections can be caused by various viruses or bacteria and are easily transmitted from person to person, especially in crowded areas such as refugee camps like Kakuma. Symptoms may include cough, runny nose, sore throat, fever, and difficulty breathing. To prevent respiratory infections, it is important to practice good hygiene, such as regular handwashing, covering the mouth and nose when coughing or sneezing, and avoiding close contact with sick individuals.

2. Gastrointestinal Infections:

Gastrointestinal infections, commonly referred to as stomach bugs, are another common childhood illness. They are usually caused by a variety of bacteria, viruses, or parasites, and can cause symptoms like diarrhea, vomiting, stomach pain, and fever. These infections are often spread through contaminated food, water, or poor hygiene practices. To prevent gastrointestinal infections, it is crucial to maintain proper sanitation and hygiene. This includes proper handwashing, safe food handling

	and preparation, drinking clean water, and using proper sanitation facilities.  3. Malaria:										
	Malaria is a mosquito-borne infectious disease that remains a significant health concern in many parts of										
	Africa, including Kakuma. It is caused by a parasite transmitted through the bite of infected mosquitoes.										
	Common symptoms of malaria may include fever,										
	headache, fatigue, muscle aches, and chills. Malaria can be life-threatening if left untreated, particularly in young										
	children and individuals with compromised immune systems. Prevention strategies include the use of										
	insecticide-treated bed nets, indoor residual spraying,										
	and taking anti-malarial medications as prescribed.										•
